

Workforce Risk & Value Dashboard — Project Documentation

Overview

An HR analytics dashboard built in Power BI to help organizations identify high-value employees, flag retention risks, and evaluate cost efficiency across 200 employees in 5 departments.

Data Profile

11 columns covering employee demographics, performance, satisfaction, and compensation. Key fields used: Productivity, Satisfaction Rate, Feedback Score, Projects Completed, Salary, and Joining Date. Data was cleaned in Power Query — dates standardized, tenure calculated, and employees segmented into age and tenure bands.

Metrics & How They Were Built

7 custom DAX measures were created, each solving a specific HR problem:

Metric	Purpose
PES	Measures output quality, not just volume
EVI	Composite score combining productivity, satisfaction and feedback
CPPU	Flags departments with high spend but low output
FRS	Predicts which employees are most likely to leave
EOR	Reveals whether long-serving staff are still delivering
Engagement Discord	Detects misalignment between how employees feel and how they perform
Salary Equity Ratio	Checks pay fairness within position and department peer groups

Key Findings

Performance: IT is the highest performing department with a PES of 6.3. Marketing is the lowest at 4.9 despite completing the most projects, indicating volume over quality.

Cost: Marketing costs \$895 per productive unit — nearly 4x IT at \$242. Finance and Sales sit in the mid-range at \$541 and \$455 respectively.

Retention Risk: Average Flight Risk Score across the organisation is 47.0. Finance and HR are the highest risk departments. Five employees exceed a FRS of 83, all requiring immediate HR intervention.

Employee Value: Managers and Junior Developers lead on EVI at 55 and 54 respectively. Analysts score lowest at 47, suggesting a recognition or development gap. Top individual is Michelle Perez with an EVI of 95.

Engagement: IT shows the highest engagement discord at 0.33, meaning employees there perform well externally but report internal dissatisfaction a hidden management problem.

Tenure: The 6–10-year tenure band delivers the highest Experience-Output Ratio at 1.2. Employees with 10+ years drop to 0.9, indicating potential stagnation in long-serving staff.

Pay Equity: No significant salary outliers were found. Junior Developers show the widest variance within their peer group at 0.081 standard deviation, worth monitoring as headcount grows.

Recommendation

Prioritize retention conversations with high FRS, high EVI employees immediately. Review Marketing's cost structure and investigate IT's engagement discord before it becomes an attrition problem.
